Chapter 1

Overview

13

15

- Modern computing systems contain a variety of memory types, each closely associated with a distinct type of computing hardware. For example, compute accelerators such as GPUs typically feature their own memory that is distinct from the memory attached to the host processor. Additionally, GPUs from different vendors also differ in their memory types. The differences in memory types influence feature availability and performance behavior of an application running on such modern systems. Hence, MPI libraries need to be aware of and support additional memory types. For a given type of memory, MPI libraries need to know the associated memory allocator and the limitations on memory access. The different memory kinds capture the differentiating information needed by MPI libraries for different memory types.
 - This MPI side document defines the memory allocation kinds and their associated restrictors that users can use to query the support for different memory kinds provided by the MPI library. These definitions supplement those found in section 11.4.3 of the MPI \top (Fin2) standard, which also explains their usage model.

Chapter 2

₂ Definitions

3 This section contains definitions of memory allocation kinds and their restrictors.

4 2.1 Kind: cuda

The cuda memory kind refers to the memory allocated by the CUDA runtime system [1].

6 Restrictors

27

- host: Support for memory allocations on the host system that are page-locked for direct access from the CUDA device (e.g., memory allocations from the cudaHostAlloc() function). These memory allocations are attributed with cudaMemoryTypeHost.
- device: Support for memory allocated on a CUDA device (e.g., memory allocations from the cudaMalloc() function). These memory allocations are attributed with cudaMemoryTypeDevice.
 - managed: Support for memory that is managed by CUDA's Unified Memory system (e.g., memory allocations from the cudaMallocManaged() function). These memory allocations are attributed with cudaMemoryTypeManaged.

16 2.2 Kind: rocm

The rocm memory kind refers to the memory allocated by the ROCm runtime system [2].

18 Restrictors

- host: Support for memory allocated on the host system that is page-locked for direct access from the ROCm device (e.g., memory allocations from the hipHostMalloc() function). These memory allocations are attributed with hipMemoryTypeHost.
- device: Support for memory allocated on the ROCm device (e.g., memory allocations from the hipMalloc() function). These memory allocations are attributed with hipMemoryTypeDevice.
 - managed: Support for memory that is managed automatically by the ROCm runtime (e.g., memory allocations from the hipMallocManaged() function). These memory allocations are attributed with hipMemoryTypeManaged.

2.3 Kind: levelzero

The levelzero memory kind refers to the memory allocated by the Level Zero runtime system. [2]

4 Restrictors

- host: Support for memory allocated on the host that is accessible by Level Zero devices (e.g., memory allocations from the zeMemAllocHost() function). These memory allocations are attributed with ZE_MEMORY_TYPE_HOST.
- device: Support for memory allocated on a Level Zero device (e.g., memory allocations from the zeMemAllocDevice() function). These memory allocations are attributed with ZE_MEMORY_TYPE_DEVICE.
- shared: Support for memory allocated that will be shared between the host and one or more Level Zero devices (e.g., memory allocations from the zeMemAllocShared() function). These memory allocations are attributed with ZE_MEMORY_TYPE_SHARED.

₁ Annex A

₂ Changelog

- $_3$ This annex summarizes changes from the previous versions of the Memory Allocation Kinds
- 4 side document to the version presented by this document.

5 A.1 Version 1.0

6 1. The first version of this document.
